

Gross Domestic Product

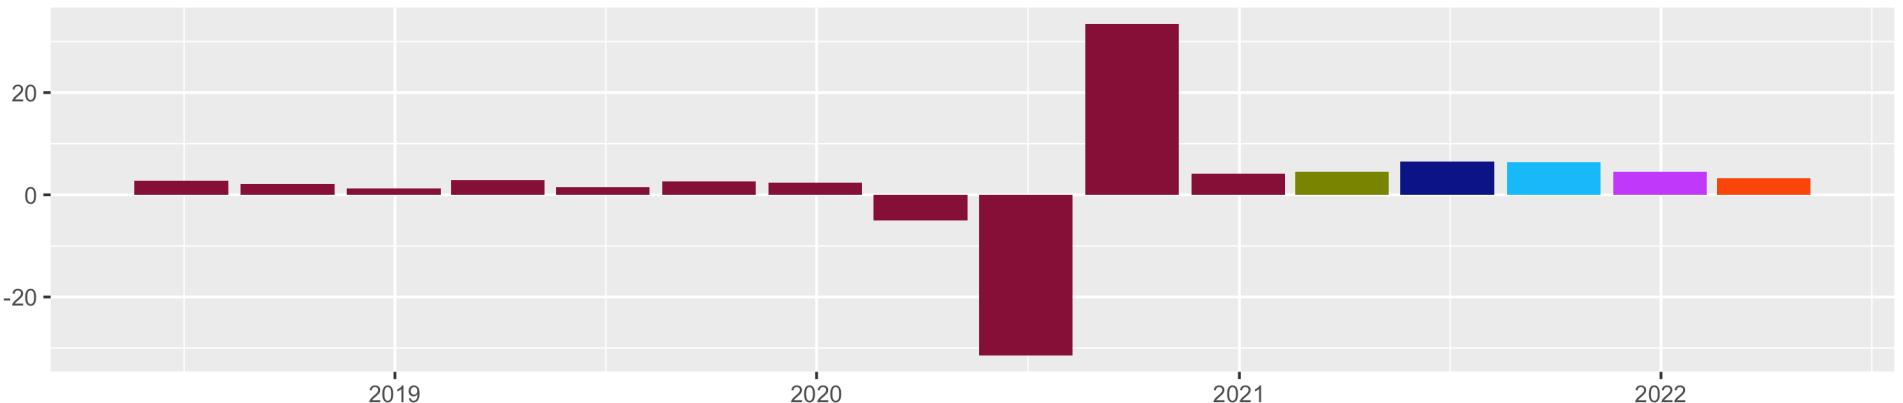

The full weight of the coronavirus weighed on US economic output during the second quarter. The economy contracted an annualized 31.4 percent from the first quarter. The 33.4 percent rebound in the third quarter was as dramatic. Personal consumption grew at a 41.0 percent annualized pace and accounted for about three-quarters of the total growth in the economy. Fixed investment and inventory replenishment both made positive contributions, while international trade subtracted roughly 3 percentage points from overall growth. Total economic output remains 3.5 percent below the pre-pandemic level.

Consumption

If a vaccine for COVID-19 is made available and accepted by Americans in early 2021, we could see a sharp acceleration in personal consumption led by service categories. These categories of consumption, such as spending at restaurants and hotels, were the hardest hit by the pandemic and have had the most difficulty accommodating social distancing requirements. Even though services spending has increased 16 percent from the April low point, it is still 5.3 percent below the pre-pandemic level. Meanwhile, goods spending has already surpassed pre-pandemic levels.

Labor Market

Though the labor market has seen extraordinary job growth in the second quarter, conditions are still dismal. Over the last seven months, monthly payroll growth has averaged 1.8 million after losing a net 22.2 million jobs in the March and April. The labor market is still 9.8 million jobs short of the pre-pandemic level. The unemployment rate has declined to 6.7 percent from 11.1 percent at the end of the first quarter and April's 14.7 percent. Though improving, this is still an extraordinarily high level. There are also worrying signs that the unemployed are increasingly losing touch with the labor market. For instance, labor force participation has nearly declined two percentage points from the January level and shows signs of stagnating at these low levels.
